CarePort® Insight

Real-time post-acute performance data for real-world impact

CarePort Insight enables hospitals and providers to build and maintain effective post-acute collaboratives, monitor and optimize provider performance with real-time measures, and track outcomes for patient cohorts across the care continuum using one unified platform.

Monitor post-acute performance in real-time before claims data is available

Rely on objective data, removing the hassles of self-reporting

Use one comprehensive tool with data from multiple care settings

Network management

Build effective and efficient collaborative provider networks by leveraging curated sets of risk-adjusted, real-time measures and public data that puts relevant quality and efficiency measures at your fingertips, including the CarePort Quality Score, a composite score that captures various domains of SNF quality for short-stay SNF populations.

Performance management

Monitor the performance of your provider partners in real-time – eliminating the need for self-reporting and enabling faster identification and intervention when problems arise.

Program management

Track cross-continuum outcomes, including 30-60-90-day readmission rates, length of stay (LOS), and timely care deliveries for patients enrolled in specific programs most important to your organization (ACOs, BPCI-Advanced, high utilizers, etc.) to ensure improved outcomes and care delivery.
